Connect Four Lab - Chat History
Visible user and assistant messages

User:
https://github.com/Varchas-Shetty/15_connect_four
Instructions: go to the assigned repo; read the README; clone or fork; run the Python game; record 10 seconds before changes; write prompts and fix broken code; implement README features one by one; record 10 seconds after; push to your repo; do not raise a PR to SETAPESU26. Deliver the videos and updated code under Lab-4 in the Lab repo.

Assistant (progress):
I?ll inspect the repository README and project state first, then run the game and determine what recording options are available here. I?ll preserve the requested before-change video before touching the code, and then work through the README?s fixes and features.

Assistant (progress):
The README says the defects are missing diagonal detection and a random AI, with additional termination and move-feedback requirements. The current origin points at the source repository, so I?ll first capture the baseline and check the available recording/GitHub tooling; I?ll avoid pushing back to that source remote.

Assistant (progress):
The baseline run confirms the game starts, but this workspace is a noninteractive console and has no screen recorder or video encoder installed. I can?t honestly create a screen recording from it. I?m moving ahead with the code fixes and README-required edge-case checks; I?ll keep the original broken state available from Git so the before/after behavior can be demonstrated once a recording session is available. GitHub CLI is also logged in with an invalid token, and the linked repository is the source repo rather than a Lab repo, so I won?t attempt an external push to the wrong destination.

Assistant (progress):
The fixes are in place, and the manual acceptance checks pass for all four win directions, shorter non-wins, invalid/full columns, AI wins and blocks, draw detection, quitting, and stopping after a win. I?m preparing a Lab-4 submission folder with the updated code and task-by-task prompts. The video files and final push still depend on capabilities or destination details this environment doesn?t provide.

Assistant:
Implemented the README tasks in the working tree and copied the updated code into Lab-4/code. The fixes add both diagonal win checks, consistent handling for invalid input and terminal states, immediate AI wins and blocks, and one feedback message per successful move.

Manual acceptance checks passed for all four win directions, short runs, invalid and full columns, AI win/block choices, draw detection, quitting, and stopping immediately after a win. git diff --check also passed.

I couldn?t complete the videos or push: this console has no screen recorder or video encoder, and GitHub CLI authentication is invalid. The only configured remote is the source repository,

so I did not push there. The prompts are in Lab-4/LLM_PROMPTS.md; it notes where to add the chat share link. The remaining items are to record the before/after clips, add the chat link, and push Lab-4 to your Lab repo once its remote and valid GitHub authentication are available.

User:
so what do i need to do

Assistant:
You need to finish these three submission steps: (1) record two 10-second clips showing the original diagonal-win bug and the fixed game; (2) use the chat Share control and add its link to Lab-4/LLM_PROMPTS.md; (3) upload Lab-4 to your Lab repo and push there. The updated code is already in Lab-4/code. Don?t push from the current project because its origin is the source repo.

User:
tell me step wise what do i need to do

Assistant:
1. In VS Code, open Terminal > New Terminal. 2. Run the original game with python main.py and record 10 seconds showing the before behavior. 3. Run the updated game with python Lab-4/code/main.py and record 10 seconds; save both clips under Lab-4/videos. 4. Use the chat Share control and add the link to LLM_PROMPTS.md. 5. Copy the completed Lab-4 folder into your Lab repo. 6. From the Lab repo terminal, run git add Lab-4, git commit -m "Complete Connect Four lab", and git push. Check that the terminal is in the Lab repo before pushing.

User:
for original code what should be my input sequence

Assistant:
A possible sequence against the random AI is 4, 3, 5, 2, 6, 1, 7, but the AI may interfere. A deterministic demonstration is to set up a diagonal position in the original game before starting, then enter the winning column. Restore the original main.py after recording the before clip.

User:
These are the videos: after.mp4 at C:\Users\akash\Videos\after.mp4; before.mp4 at C:\Users\akash\Videos\before.mp4. My request: these are the videos.

Assistant (progress):
I?ll copy both clips into the project?s Lab-4 submission folder and verify they?re there.

Assistant:
Both videos are now in Lab-4/videos: before.mp4 and after.mp4. Copy the Lab-4 folder into your Lab repo, add the chat share link to LLM_PROMPTS.md, then commit and push from the Lab repo.

User:
do it

Assistant:
The videos and updated code are ready in Lab-4, but I need two details before I can finish the upload: (1) is Varchas-Shetty/SELAB your Lab repo? It?s the likely match I found, but I don?t want to upload your work to the wrong repository; (2) send the chat Share link to add to LLM_PROMPTS.md. I can?t generate that link from here. Once you provide those, I can add the link and upload Lab-4 to the confirmed repo.

User:
https://github.com/Varchas-Shetty/15_connect_four

Assistant (progress):
Got it. I?ll treat Varchas-Shetty/15_connect_four as the destination you intend, and upload the Lab-4 folder contents there without creating a PR. I?ll check the branch and folder first; the chat share link is still missing, so I?ll leave its placeholder intact.

Assistant (progress):
The destination is confirmed as your personal 15_connect_four repository, and I verified the remote still has the original broken code. I?m uploading the Lab-4 folder contents as a direct commit there; the videos are the files you supplied.

Assistant:
Uploaded Lab-4 to your repository?s main branch in commit cfd20cc (https://github.com/Varchas-Shetty/15_connect_four/commit/cfd20ccee7c1eda0e79c228afba9a96ba4b77fc4). It includes the updated code, prompts, and both videos. I verified the files are present. No PR was opened. The chat share link is still missing, so LLM_PROMPTS.md has a note where it needs to go. Send me the link and I can add it in a follow-up commit.
